How to use this report for an independent review

This PDF contains selectable text and a complete machine-readable JSON copy (final pages, and attached to the PDF as a file). Upload it to an AI assistant and ask, for example:

> "You are an experienced FPL manager. Using only this report, review the squad, starting XI, captain, bench order and any transfer or chip advice for this gameweek. Point out risks, anything the model may have missed, and what you would change and why. Do not invent statistics that are not in the report."

- Check the captain/vice choice against fixtures and minutes security.
- Check each starter's start probability and any warnings, especially flagged players.
- Sanity-check xPts breakdowns (appearance, goals, assists, clean sheet, bonus) for implausible values.
- Challenge the transfer decision (save vs move vs hit) and the chip verdicts using the next-five-gameweek fixtures.
- Look for club-concentration, bench-quality and budget-use issues.

Transfer recommendations (MODEL)

Decision: Make one transfer [transfer]. Net +3.0 weighted pts over 5 GWs for free, ahead of saving (the next-best use of a transfer is banking it).

Judged over the next five gameweeks with discount weights 1/0.9/0.8/0.7/0.6; net = discounted gain minus 4 per transfer beyond the free allowance; selling prices and bank respected.

Option	This GW	5-GW gain	Hit	Net	FT after	Moves
Save your free transfer	0.0	0.0	0	0.0	3	none
Make one transfer [recommended]	0.7	3.0	0	3.0	2	Evanilson -> Haaland
Make two transfers	0.7	3.8	0	3.8	1	Evanilson -> Haaland; Dasilva -> Muharemović
Consider a -4 hit (3 transfers)	0.3	4.0	-4	-0.1	1	Evanilson -> Haaland; Hill -> De Cuyper; Ødegaard -> Mbeumo

Option	This GW	5-GW gain	Hit	Net	FT after	Moves
Consider 2 hits (4 transfers)	0.4	4.1	-8	-3.9	1	Evanilson -> Haaland; Dasilva -> Muharemović; Hill -> De Cuyper; Ødegaard -> McGinn

Evanilson -> Haaland: Evanilson projects 4.8 pts next GW and 18.2 over the run. Haaland projects 5.5 pts (100% to start), xGI/90 0.80, form 6.2, next-5 fixture difficulty 3.6 vs 3.4. Costs £9.3m more; +3.0 weighted pts over 5 GWs. (net 3.0, deduction 0)

Sell shortlist (weakest-value players and best alternatives):

Evanilson (sell £6.5m, Projects 4.8 next GW) -> Haaland (+3.0), N.Jackson (+1.4), Calvert-Lewin (-1.3)
Barry (sell £5.7m, Projects 4.7 next GW) -> Haaland (+1.5), N.Jackson (+0.1), Calvert-Lewin (-2.8)

Model, confidence and known limitations

Deterministic expected-points model built from FPL's scoring table: appearance + goals + assists + clean sheet + goals conceded + saves + defensive contribution + bonus + cards, with a bounded form tilt. Goal/assist rates blend 0.8*xG/xA + 0.2*actual, shrunk to the positional average by minutes (reliability = minutes/(minutes+450)). Fixture strength uses opponents' goals and xG for/against with home advantage. Squads come from an integer-linear-programming optimiser (not an LLM).
confidenceScore = 0.45*sample size + 0.25*availability certainty + 0.30*start probability; high >= 0.7, medium >= 0.45, else low.
Backtest (GW5-GW10, 1338 player-gameweeks): model MAE 2.3 vs points-per-game baseline 2.57; bias 0.05; captain avg 5.33 vs 2.67. Small sample (6 gameweeks); availability news is not point-in-time in the backtest.

- xPts are estimates; the model has no access to team news beyond FPL's status/news fields.
- No shots-on-target or box-touch data; opponent xGC is derived from the first-choice goalkeeper.
- Future prices are not predicted; selling prices use today's prices.
- Small backtest sample; weights are heuristics, not fitted.
